

# Guide d'installation des wordlists HTB (DNS/VHosts)

Ce document explique comment générer et installer les wordlists optimisées pour les CTF HackTheBox, avec les limites 1000, 2000 et 5000 entrées.

## 1) Créer et rendre exécutable le script

```
# Copier/coller ce bloc dans un terminal :  
cat > ~/HTB/tests/make-htb-wordlist.sh <<'SH'  
... (script complet fourni précédemment) ...  
SH
```

```
# Rendre exécutable  
chmod +x ~/HTB/tests/make-htb-wordlist.sh  
dos2unix ~/HTB/tests/make-htb-wordlist.sh 2>/dev/null || true
```

## 2) Générer les wordlists en local (tests)

```
~/HTB/tests/make-htb-wordlist.sh \  
--no-install \  
--with-medium \  
--batch "1000,2000,5000" \  
--destdir ~/HTB/tests \  
--basename htb-dns-vh
```

```
# Vérification  
ls -l ~/HTB/tests/htb-dns-vh-*.txt  
wc -l ~/HTB/tests/htb-dns-vh-*.txt
```

## 3) Installer les wordlists globalement

```
sudo ~/HTB/tests/make-htb-wordlist.sh \  
--with-medium \  
--batch "1000,2000,5000" \  
--destdir /usr/share/wordlists \  
--basename htb-dns-vh
```

## 4) Utilisation avec mon-subdomains

```
# Passe rapide  
mon-subdomains site.htb -wDNS /usr/share/wordlists/htb-dns-vh-1000.txt -wVH /usr/share/wordlists/htb-dns-vh-1000.
```

```
# Passe intermédiaire  
mon-subdomains site.htb -wDNS /usr/share/wordlists/htb-dns-vh-2000.txt -wVH /usr/share/wordlists/htb-dns-vh-2000.
```

```
# Passe large  
mon-subdomains site.htb -wDNS /usr/share/wordlists/htb-dns-vh-5000.txt -wVH /usr/share/wordlists/htb-dns-vh-5000.
```
